New Technology Develops Metallic-like Surfaces in Displays

Adjusts gloss and shading in real-time according to the person's viewing angle

TOKYO, February 14, 2018 – [Mitsubishi Electric Corporation](http://www.mitsubishi-electric.com) (TOKYO: 6503) announced today that it has developed a realistic “texture expression” technology, named Real Texture, that makes vehicle displays and digital signage appear to be realistic metallic-like surfaces for added viewing appeal. Real Texture is expected to be commercialized for vehicle instrument panels and signage displays in the near future.

Real Texture implemented in a car instrument panel

Gloss and shading change in real time according to viewing angle

Real Texture Features

- Calibrates contrasting light and shade to produce realistic surface textures of various materials.
- Simulates light reflection according to the tracked position of the viewer's face.
- Constructs stereographic images by simulating the reflective properties of real materials.
- Creates beautiful representations of materials such as metals and glass.
- Consists of 2D flat display (parallax stereographic display not required) and camera to track viewer's facial position.

Background

Reflecting the rising popularity of virtual reality and augmented reality, consumers are increasingly demanding products that offer highly realistic images. Mitsubishi Electric's new Real Texture display technology enables screens to achieve realistic surface textures based on the reflectance properties of actual materials.

Patents

Pending patents for the technology announced in this news release number four in Japan and three outside of Japan.

Design Registration

Pending design registrations for the design related to the technology announced in this news release number two in Japan.

Real Texture is a trademark of Mitsubishi Electric Corporation.
